# 7 million premature deaths annually linked to air pollution

News release

**25 MARCH 2014** | GENEVA - In new estimates released today, WHO reports that in 2012 around 7 million people died - one in eight of total global deaths – as a result of air pollution exposure. This finding more than doubles previous estimates and confirms that **air pollution is now the world's largest single environmental health risk**. Reducing air pollution could save millions of lives.

## New estimates

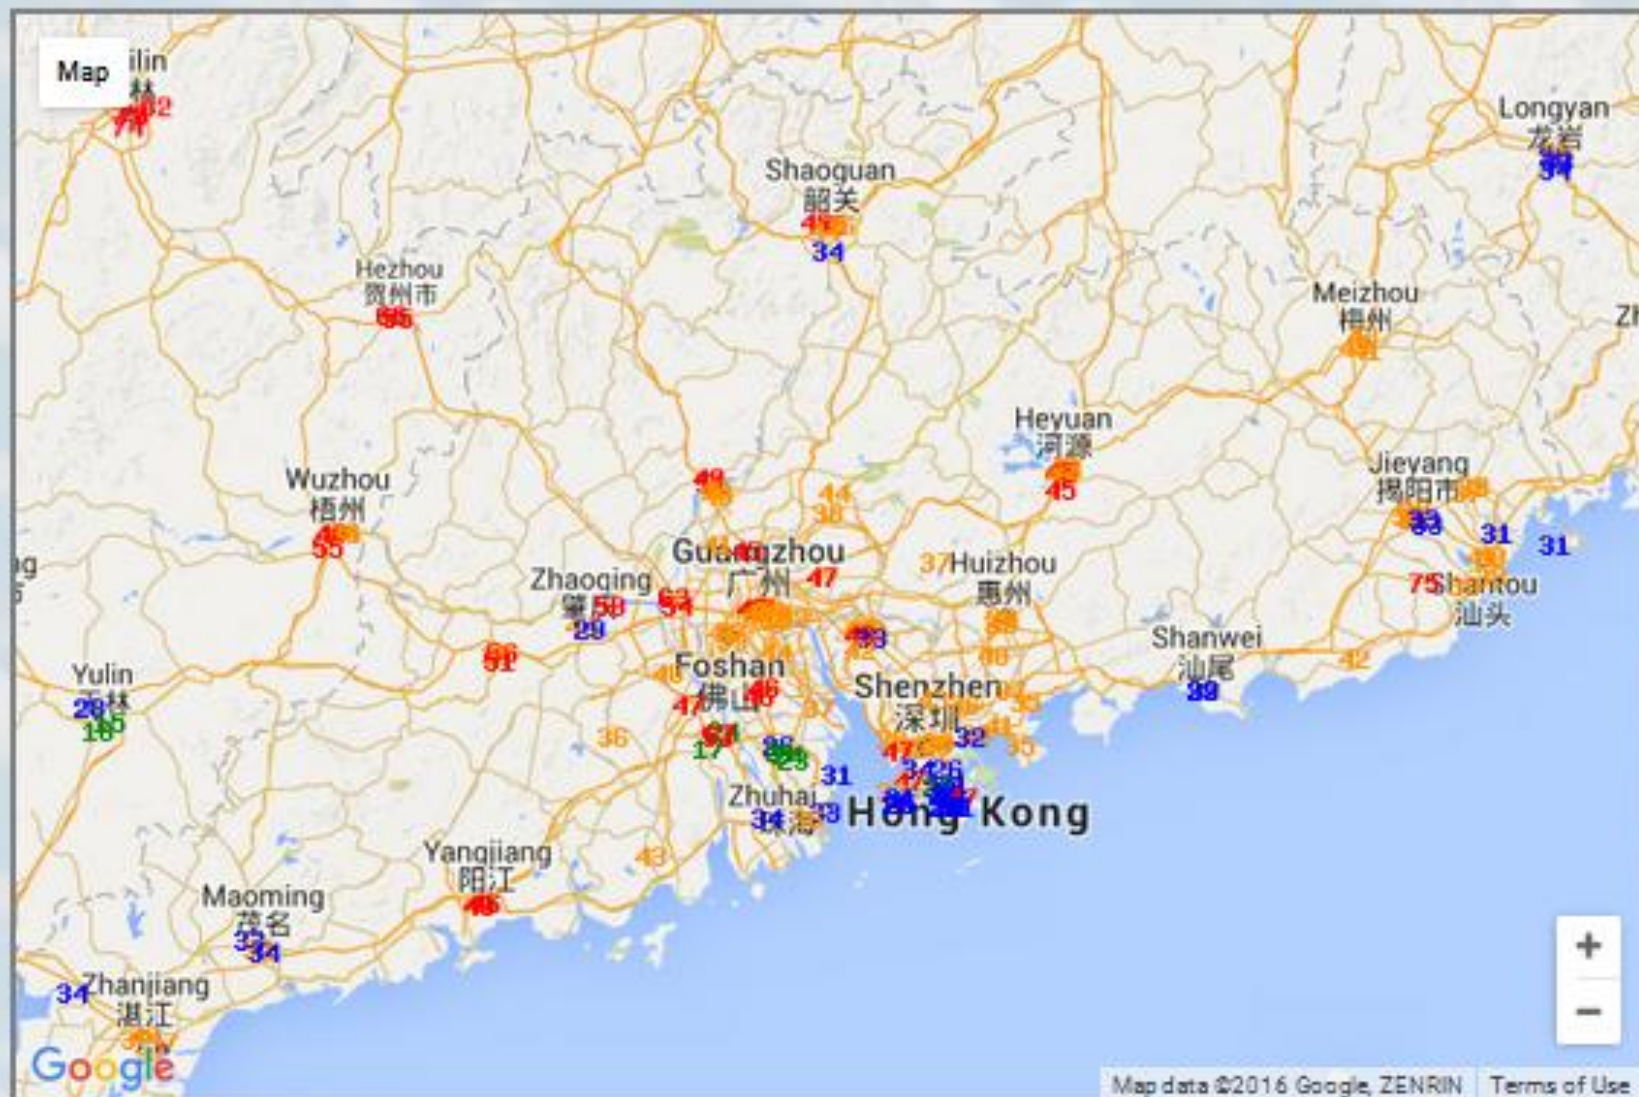

In particular, the new data reveal a **stronger link between both indoor and outdoor air pollution exposure and cardiovascular diseases**, such as strokes and ischaemic heart disease, as well as between air pollution and cancer. **This is in addition to air pollution's role in the development of respiratory diseases, including acute respiratory infections and chronic obstructive pulmonary diseases.**

**WHO (2014):  
Air Pollution  
is the world's  
largest single  
environmental  
health risk.**

**Linked to:  
cardiovascular  
respiratory  
pulmonary  
diseases**

# Spatial 2D Plot for Fine Suspended Particulates (FSPMC) ( $\mu\text{g}/\text{m}^3$ )

→ HIGHLIGHTS

**Roadside Stations** : Moderate

**Remark:**

- (1) The AQHI information is based on raw data taken directly from EPD's Air Quality Monitoring Network.
- (2) The hourly reported AQHI is for short term health risk communication; for health risks of long-term exposure of the air quality, please refer to [Annual Air Quality Index \(Annual AQI\)](#).
- (3) In case of station or equipment suspension due to maintenance, the data collection for calculation of AQHI at station will be affected, the data of a most similar station will then be adopted. Such AQHI will be shown in italics.
