Abstract

The introduction on the market of new asset condition monitoring tools and at the same time, the increasing pressure from Utility Commissions and stakeholders for a more structured approach in regards to the justification of assets replacement, are today the main drivers for an integrated strategy when dealing with asset information and the planning of maintenance activities. This presentation will introduce an innovative solution allowing engineers, researchers and technicians to improve in a structured way the performance and reliability of systems and components in the context of limited availability of capital and the aging of workforces and assets. It will also highlight the benefits of accessing directly in the field, assets and maintenance information in real-time.
