What is HVDC?

HITACHI

① Long distance・low losses

## What is HVDC?

① HVDC can transmits remote and large-scale renewable energy to demand centers, over a long distance with low losses

(example of Japan)

● : Demand center    ● : Large renewables

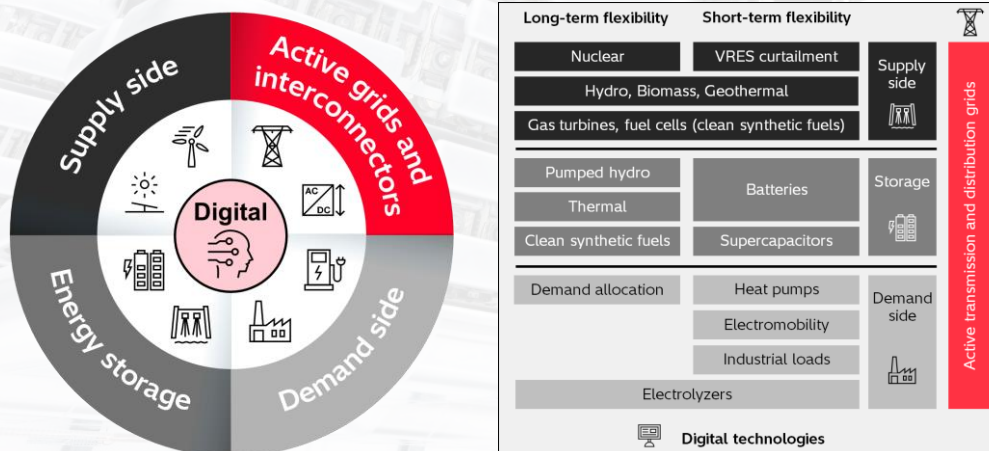

- ① Long distance·low losses, ② Cross-borders

## What is HVDC?

- ① HVDC transmits remote and large-scale renewable energy to demand centers, over a long distance with low losses
- ② HVDC enables to share·exchange grid flexibility across borders (countries, regions)

Four dimensions of “flexibility”

(example of Japan)

- ① Long distance·low losses, ② Cross-borders, ③ Grid stability

## What is HVDC?

- ① HVDC transmits remote and large-scale renewable energy to demand centers, over a long distance with low losses
- ② HVDC enables to share network flexibility across borders (countries, regions)
- ③ HVDC supports grid stability by Fast Frequency Response, synthetic inertia response, fast reactive power (voltage) control, grid forming, islanded network control, black start etc.

## Key technology for Energy Transition

- International HVDC interconnectors
- HVDC systems allow our customers to share and trade electricity. Sending power where it is most profitable and needed most.
- HVDC enables precise controlled power flow across electricity markets.

# Environmental benefits DC vs AC

HVDC has a lower climate impact above certain distances, thanks to:

- Lower transmission losses
- Materials for cables

\*100 km cable transmission, 900MW  
Including: HVDC or HVAC Station, Cable, Total Losses and End of Life

Traditional overhead line with AC

HVDC (High Voltage Direct Current) Classic overhead line

Underground line with HVDC Light® or AC cable

## Benefits of HVDC

HVDC transmission delivers significant benefits not only from a technical power system standpoint but also from an economic, environmental and societal perspectives.

Technical	Economic	Environmental	Societal
<ul style="list-style-type: none"> <li>● Enables high power transmission capacity, currently up to 12 GW at <math>\pm 1,100</math> kV spanning &gt;3,000 km.</li> <li>● Minimizes long-distance power losses.</li> <li>● Contributes to AC grid flexibility with independent voltage and frequency control.</li> <li>● Enhances grid resilience with black start capability.</li> <li>● Connects grids with different frequencies (asynchronous grids)</li> <li>● Manages congestion through its more precise control of power flow.</li> </ul>	<ul style="list-style-type: none"> <li>● Lowers wholesale electricity prices by integrating diverse energy markets.</li> <li>● Reduces balancing and redispatch costs with improved control.</li> <li>● Offers lower operational costs over its whole life cycle owing to reduced energy losses and cuts infrastructure costs with narrower Right of Way.</li> <li>● Reduces the need for intermediate substations due to fewer voltage drops over long distances.</li> <li>● Encourages generation capacity investments by improving grid reliability and stability.</li> </ul>	<ul style="list-style-type: none"> <li>● Accelerates decarbonization by integrating clean energy sources such as wind, solar and hydro electricity.</li> <li>● Minimizes landscape impact by reducing the transmission footprint (fewer towers and conductors).</li> <li>● Optimizes resource use by enabling the transfer of electricity from regions with surplus to those with limited generation capacity.</li> <li>● Lowers electromagnetic field emissions.</li> </ul>	<ul style="list-style-type: none"> <li>● Increases ability to integrate renewables, thereby enhancing public health outcomes by improving air quality.</li> <li>● Boosts the environmental well-being of local communities by reducing land use.</li> <li>● Reduces the socio-economic impact of outages with black start capability, which enables the rapid restoration of grids.</li> <li>● Promotes regional collaboration through energy trading.</li> </ul>

What is HVDC?

## Benefits of HVDC ~Europe's case~

In Europe, enhancing cross-border interconnection capacity is seen as being socially and economically effective. EU's plan for cross-border capacity keeps increasing (according to Ten Year Network Development Plan).

### TYNDP 2020

**93 GW**  
cross-border capacity  
increases needed by 2040

**93 GW in 20 years**

※ Average **4.6 GW / year**

**Accelerating**

### TYNDP 2022

**64 GW**  
cross-border capacity  
increases needed by 2030  
(2025~2030)

**64 GW in 5 years**

※ Average **12.8 GW / year**

**Accelerating  
further**

✓ **Strong government policy toward energy transition and cost / benefit analysis (CBA) drive grid enhancement with HVDC.**

- entso-e: The European association for the cooperation of Transmission System Operators (TSOs) for electricity
- TYNDP: <https://tyndp.entsoe.eu/>

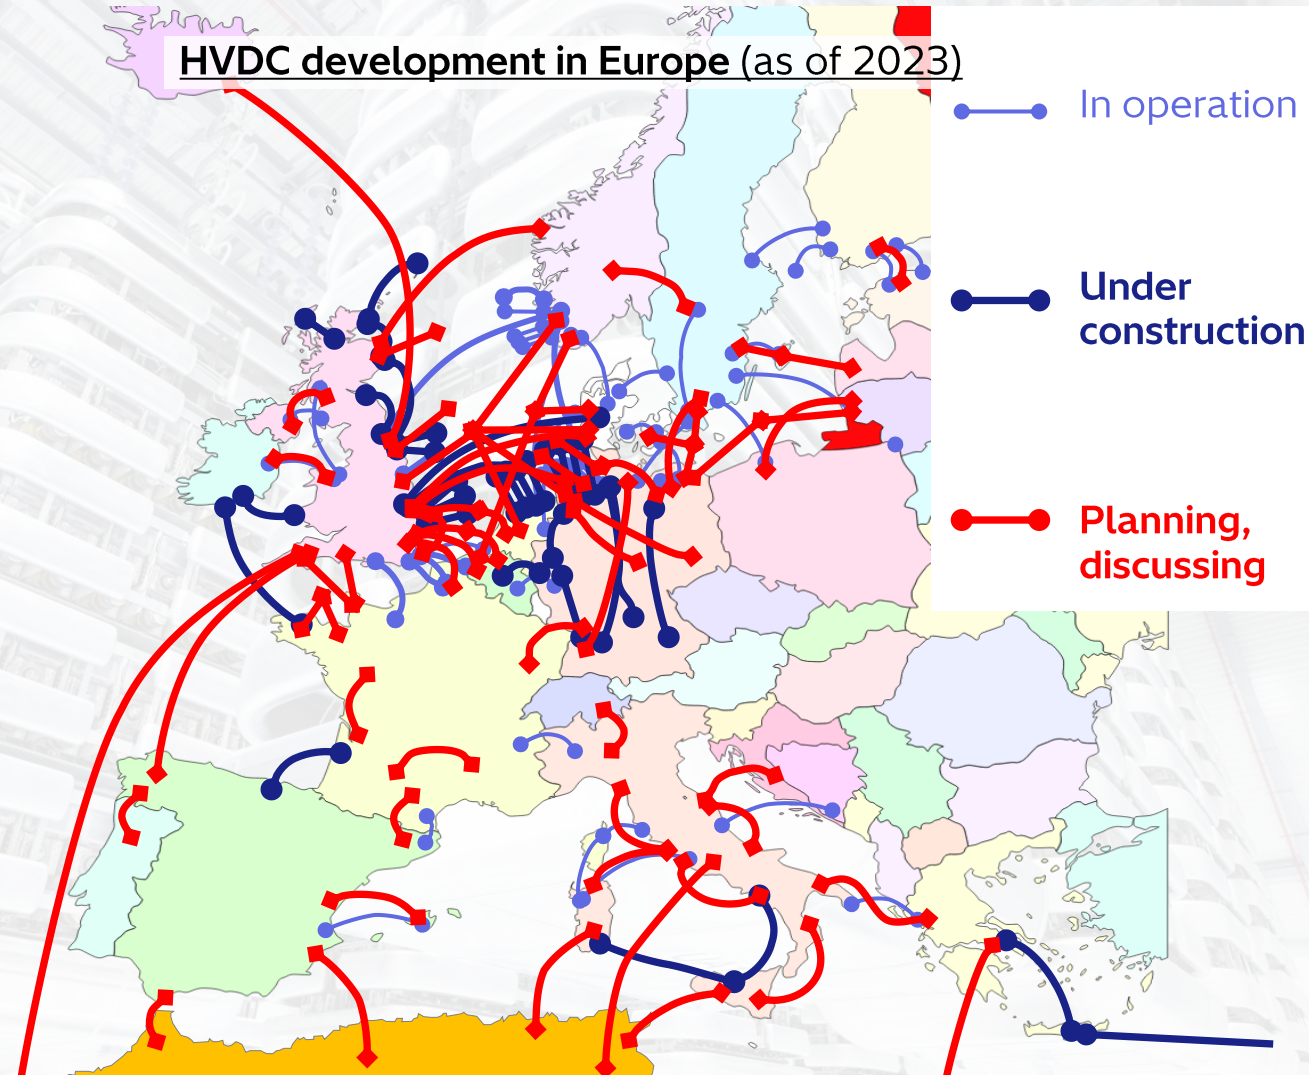

## TYNDP 2024

TODAY	2030 Starting point of the study	2040	2050
 Europe's cross-border grid needs reinforcing to yield all benefits of the energy transition and minimise costs (in the ENTSO-E area)			
126 GW available cross-border electricity transmission capacity  24 GW of storage capacity	161 GW expected cross-border capacity ↓ +88 GW of additional cross-border capacity would minimise system cost  56 GW of storage capacity*  Investment of 5 Billion euro/year	+108 GW (additional to expected capacity in 2030) would minimise system costs  227 GW of storage capacity*  Investment of 6 Billion euro/year	+224 GW (additional to expected capacity in 2030) would minimise system costs  540 GW of storage capacity*  Investment of 13 Billion euro/year
* Values for storage capacity include battery storage capacity in the scenario			
 Infrastructure projects in the pipeline today do not cover all the needs based on TYNDP 2024 projects portfolio			
	35 GW of projects in construction or in advanced stage, expected to commission by 2030	+80 GW of cross-border transmission capacity increase, based on projects expected after 2030 in National Development Plans or under consideration stage.  ➤ Gap/opportunity for infrastructure or other solutions to provide 28 GW out of the 108 GW of cross-border transmission capacity required to minimise system costs.	
 Why Europe should invest in its electricity infrastructure comparing with a hypothetical future where Europe would stop investing in its cross-border electricity grid after 2030			
	8 Bn euro/year reduction in system costs ➤ Net saving of 3 Bn euro/year  30 TWh/year avoided curtailment of RES energy in the EU  19 Mton/year avoided CO <sub>2</sub> emissions in the EU	13 Bn euro/year reduction in system costs ➤ Net saving of 7 Bn euro/year  114 TWh/year avoided curtailment of RES energy in the EU  18 Mton/year avoided CO <sub>2</sub> emissions in the EU	23 Bn euro/year reduction in system costs ➤ Net saving of 10 Bn euro/year  122 TWh/year avoided curtailment of RES energy in the EU  15 Mton/year avoided CO <sub>2</sub> emissions in the EU
By 2040, the projects in the TYNDP portfolio would benefit the EU by:  ➤ Creating 4.1 Million extra jobs ➤ Increasing its GDP by 247 Bn euro ➤ Increasing tax revenues by 111 Bn euro

# Today's HVDC Applications and Technologies

Shaping the grids of the future

## Connecting remote generation

- Down to half of the losses of AC
- HVDC technology established over many decades
- Built in grid support (voltage and frequency support)
- Generators isolated from grid transients
- Black start capability
- Smaller footprint along the right of way (high power density)

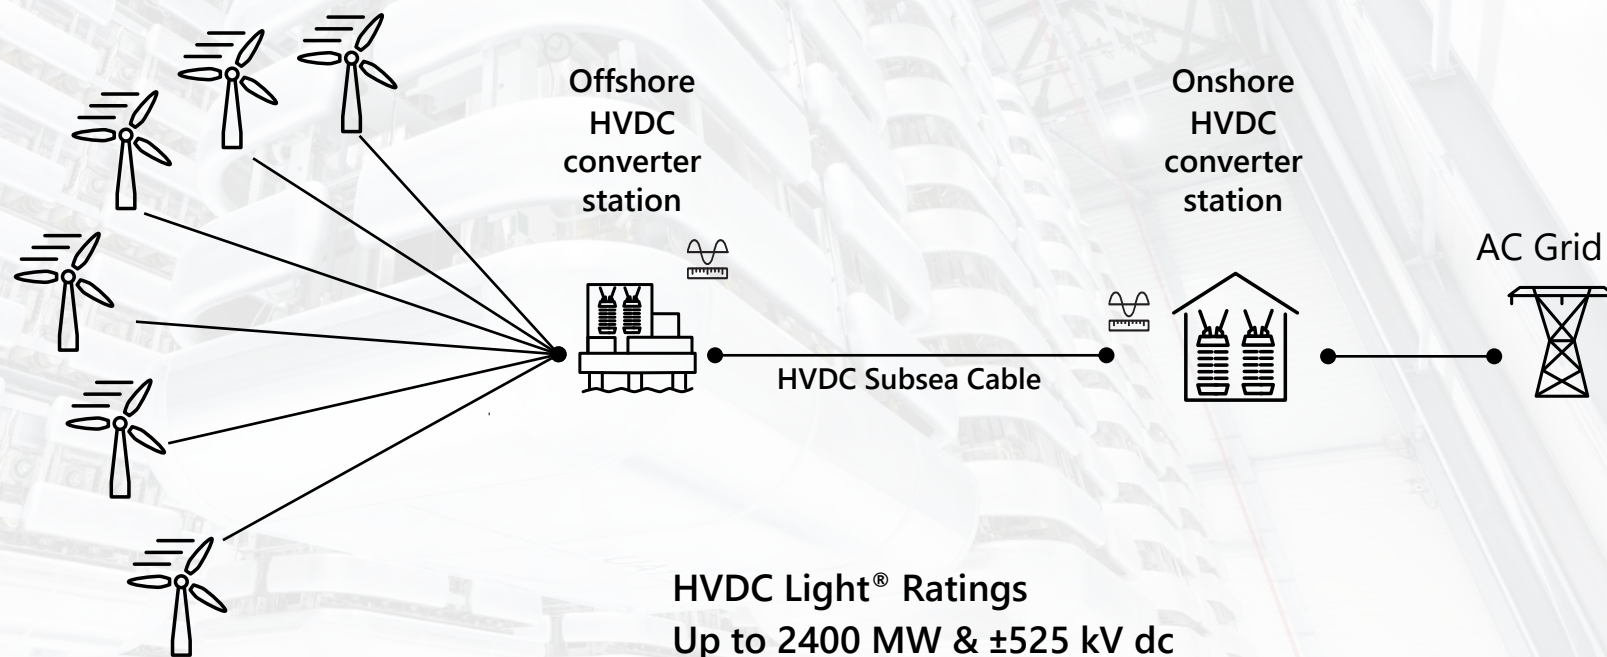

## Offshore wind connections

- Down to half of the losses of AC
- Around a third of offshore wind capacity connected by HVDC
- HVDC technology established over many decades
- Built in grid support (voltage and frequency support)
- Isolates the offshore grid from onshore grid transients

## Interconnecting grids

- Grid stabilizing with independent voltage and frequency support
- Solving today's grid resilience challenges
- Energy trading for asynchronous grids
  - Uniting & securing energy markets
- HVDC interconnectors
  - Up to thousands of kilometers and several GW power
  - Could be combined with other applications – multi-purpose links

## Back-to-back

- Share spinning reserves between adjacent networks
- Energy trading for asynchronous grids – uniting & securing energy markets
- Remove grid operational constraints
- Enhance grid resilience
- Leading to a reduced total cost of electricity

## DC links in AC grids

- Reduce system losses
- Prevent overloading of AC lines
- Allow for higher loading of generators and other AC lines
- Remove grid operational constraints
- Enhance grid resilience
- Leading to a reduced total cost of electricity

## Connecting remote loads

- Proven electrical transmission system for remote loads
- Eliminate polluting, inefficient and expensive local generation
- Provides remote, off-the-grid locations with reliable, environmentally friendly power supplies
- The surplus energy produced, from local renewable generation, can easily be exported and the back-bone AC network supported as needed

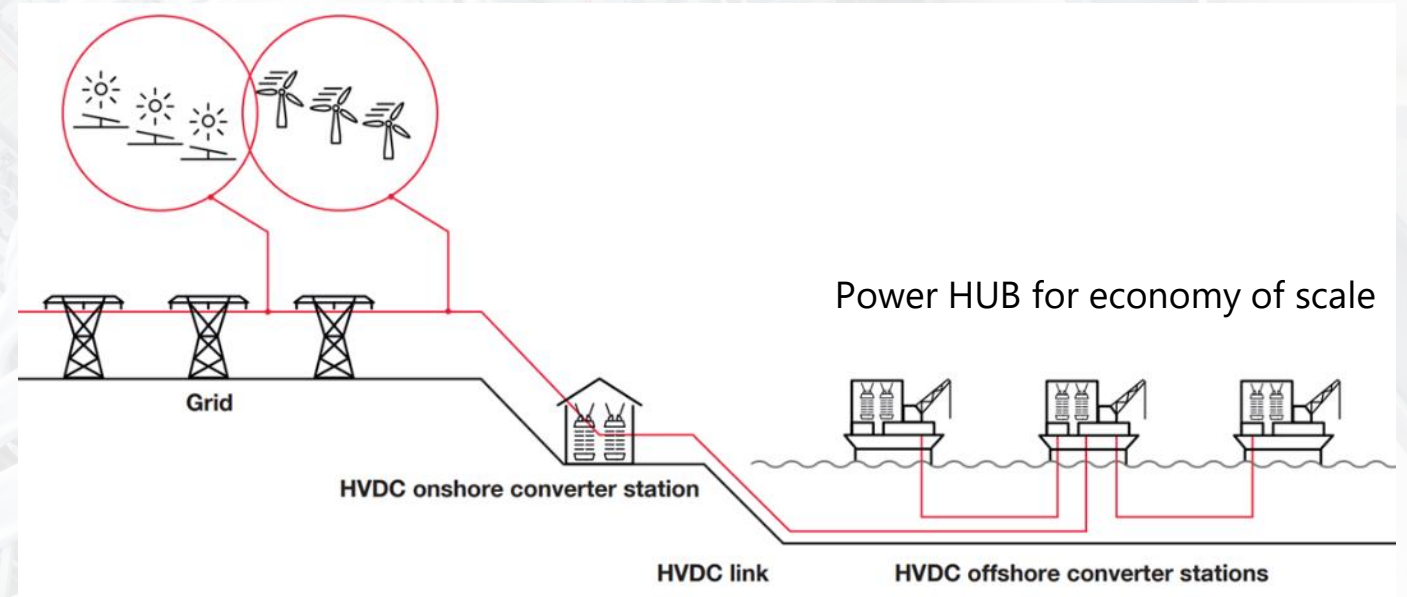

# Power from shore

- High availability and reliability
- Reduced operational costs – OPEX
- Lower GHG emissions (CO<sub>2</sub>, NO<sub>x</sub>...)
- Improved Health, Safety and working conditions (noise, vibrations...)
- Compact offshore footprint
- No power or distance limitations
- Simple frequency conversion (50/60 Hz)
- Built in grid support

## City center infeed

- Compact power station ideal for feeding large power with low losses into densely populated urban centers
- Power control capabilities are used to optimize the power flow in the existing AC lines
- Controlled contribution to short circuit currents
- Helping to reduce overall losses in the grid, increases capacity and improving stability
- Power is transmitted via oil-free extruded polymer underground cables

Typical HVDC (power / DC voltage / configuration)

Topology	Power DC voltage	Typical layout	Projects
<p><b>Symmetrical monopole</b></p> 	<p>900 ~ 1,800 MW ± 320 kV or ± 400 kV</p>	 <p>Symmetrical monopole (2 x 1.2 GW) <a href="https://doggerbank.com/construction/onshore">https://doggerbank.com/construction/onshore</a></p>	<p>DolWin 1 (800 MW) DolWin 2 (900 MW) DolWin 5 (900 MW) IFA 2 (1,000 MW) Dogger Bank A (1,200 MW) Dogger Bank B (1,200 MW) Dogger Bank C (1,200 MW) CMS (1,200 MW) Hornsea 3 (1,340 MW x 2) Lightning Zakum (1,000 MW x 2) Marinus Link (750 MW) Centre Manche (1,250 MW x 2) Oléron (1,200 MW) etc</p>
<p><b>Bipole</b></p> 	<p>2,000 ~ 3,000 MW ± 525 kV</p>	 <p>Bipole (1.4 GW)</p>	<p>NordLink (1,400 MW) North Sea Link (1,400 MW) Zhangbei (3,000 MW) SunZia (3,000 MW) Yanbu (3,000 MW) SuedLink DC4 (2,000 MW) Lanwin 5 (2,000 MW) Doordewind 1 (2,000 MW) Doordewind 2 (2,000 MW) Nederwiek 1 (2,000 MW) Nederwiek 3 (2,000 MW) IJmuiden Ver Alpha (2,000 MW) Eastern Green Link 2 (2,000 MW) Spittal - Peterhead (2,000 MW) Western Isles (2,000 MW) etc</p>

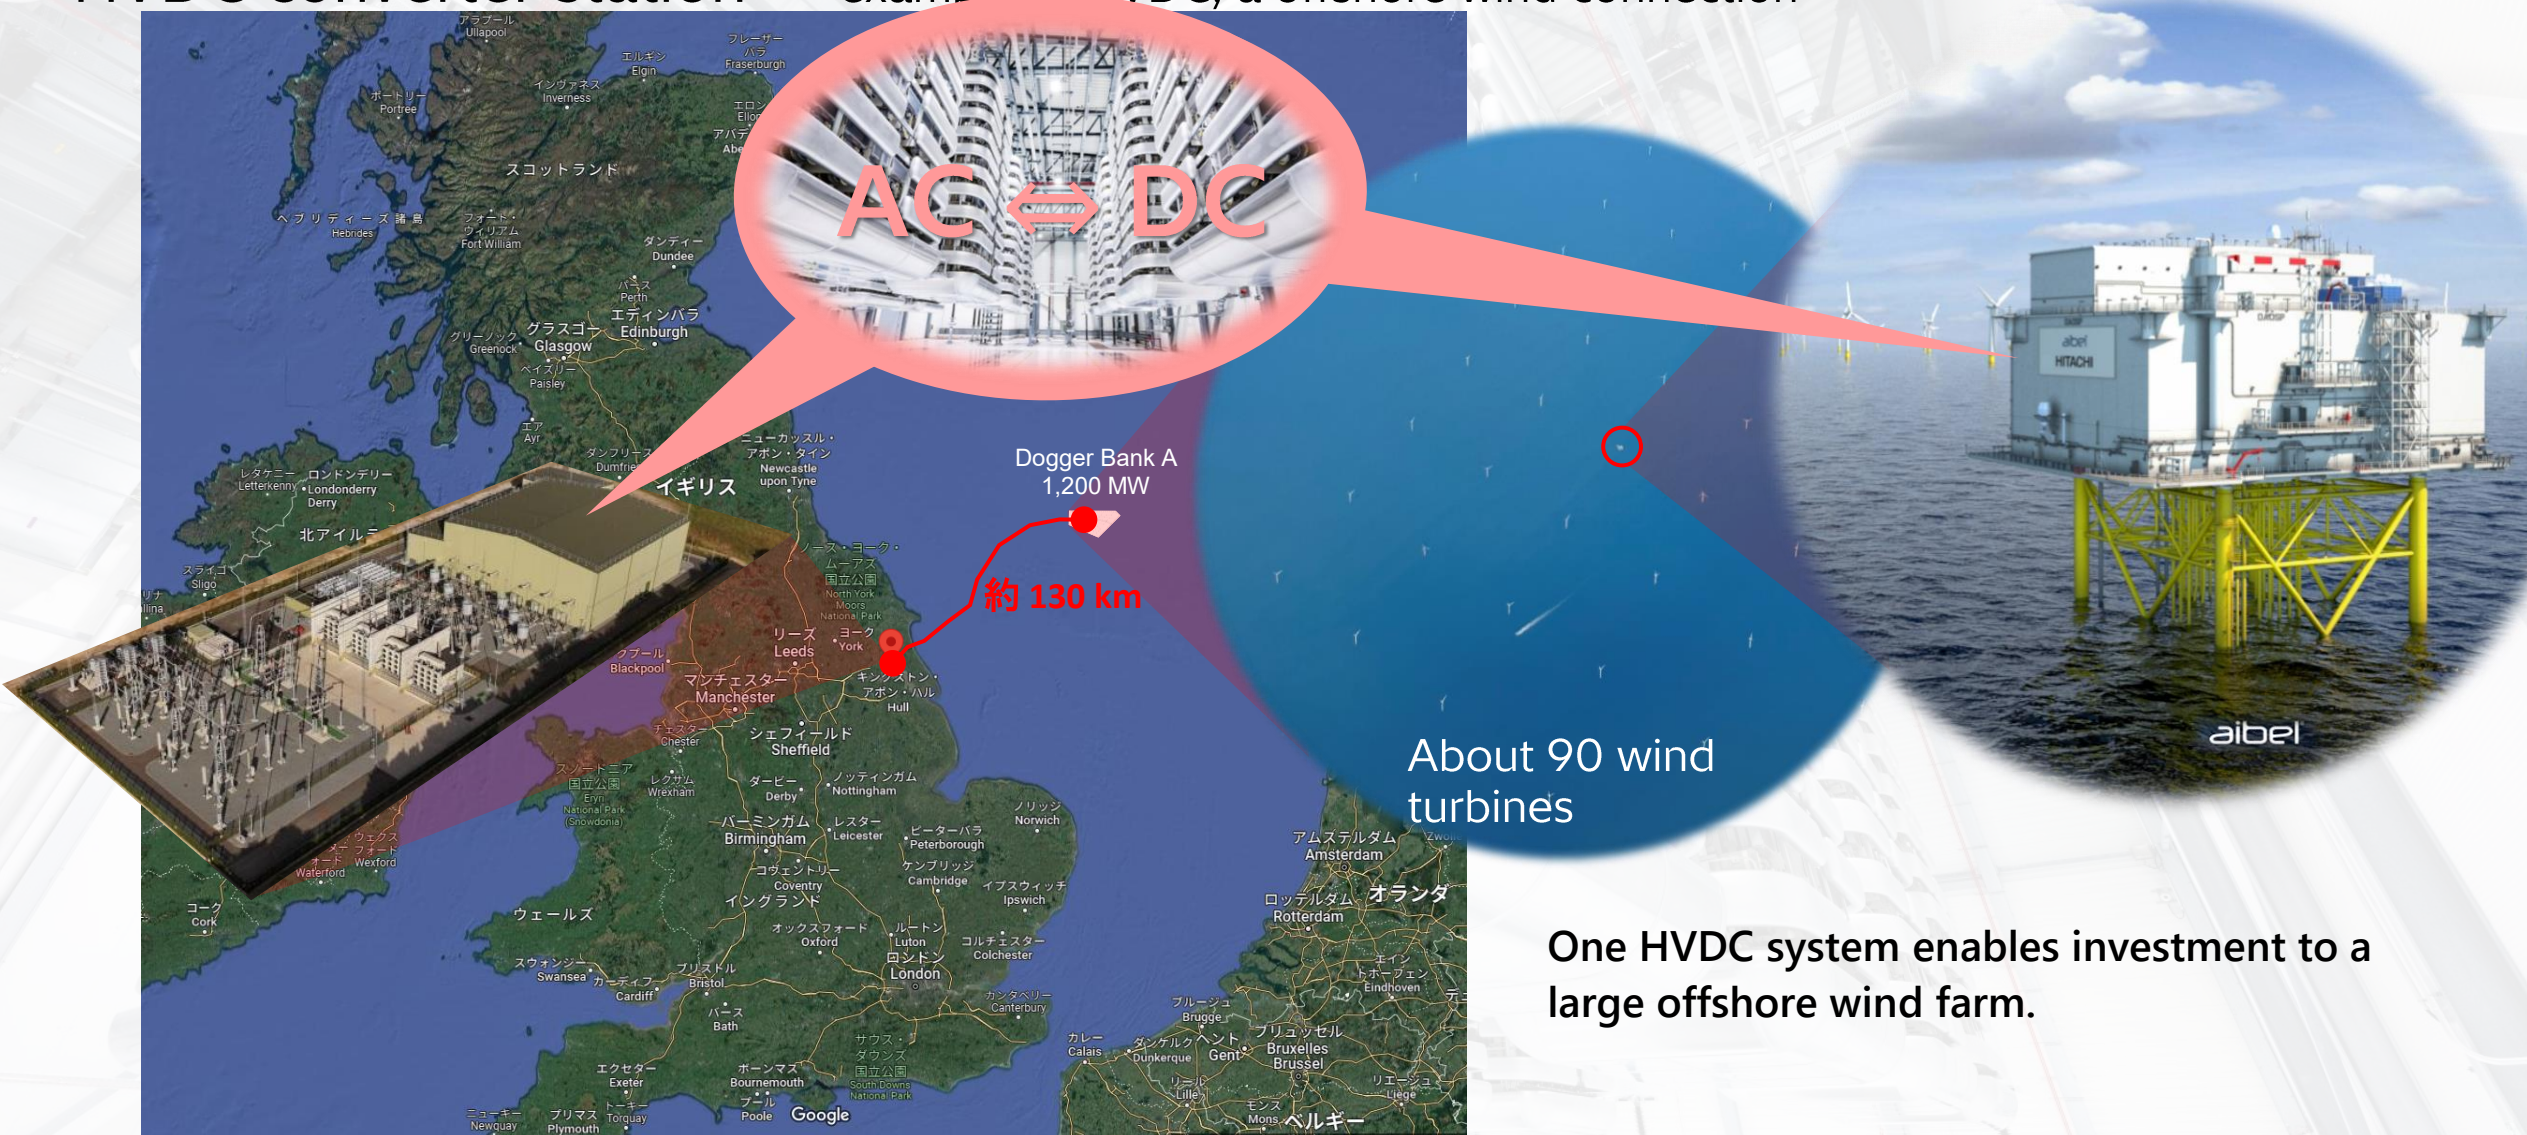

# HVDC converter station ~example of HVDC, a long-distance interconnector~

# HVDC converter station ~example of HVDC, a offshore wind connection~

One HVDC system enables investment to a large offshore wind farm.

# Long submarine cable interconnection: North Sea Link

## Customer

Statnett SF in Norway and National Grid in United Kingdom

## Customer needs

- Security of supply
- Meet EU's target for CO<sub>2</sub> reduction
- Energy trade

## Our response

- Two 1,400 MW,  $\pm 515$  kV HVDC Light<sup>®</sup> converter stations

## Customer benefits

- Security of supply
- Fluctuations in power demand to be met by using the other country's renewable surplus power

## Year

2021

HVDC Light<sup>®</sup>  
converter stations

- Bipolar  $\pm 515$  kVdc
- Kvilldal: 420 kV
- Blyth: 400 kV

Land and sea DC  
cable system

**Increased security of power supply and social-economic benefits for both countries**

## Long submarine cable interconnection: North Sea Link

Commissioned in 2021, VSC  $\pm$  515 kV / 1400 MW (bipole), cable length: 720 km

UK

Norway

<https://www.youtube.com/watch?v=gbUNrCWF3sl>

# Offshore wind connection: Dogger Bank A, B & C

## Customer

SSE & Equinor, United Kingdom

## Customer needs

- 200 km long subsea and underground power connection
- Robust grid connection

## Our response

- 3 x 1200 MW,  $\pm 320$  kV, HVDC Light® system
- Engineered package and supply for offshore and onshore converters

## Customer benefits

- Environmentally sound power transport
- Low losses and high reliability
- Increasing current offshore wind capacity by 3,6 GW and reduce CO<sub>2</sub> emissions

## Year\*

2023, 2024, 2025

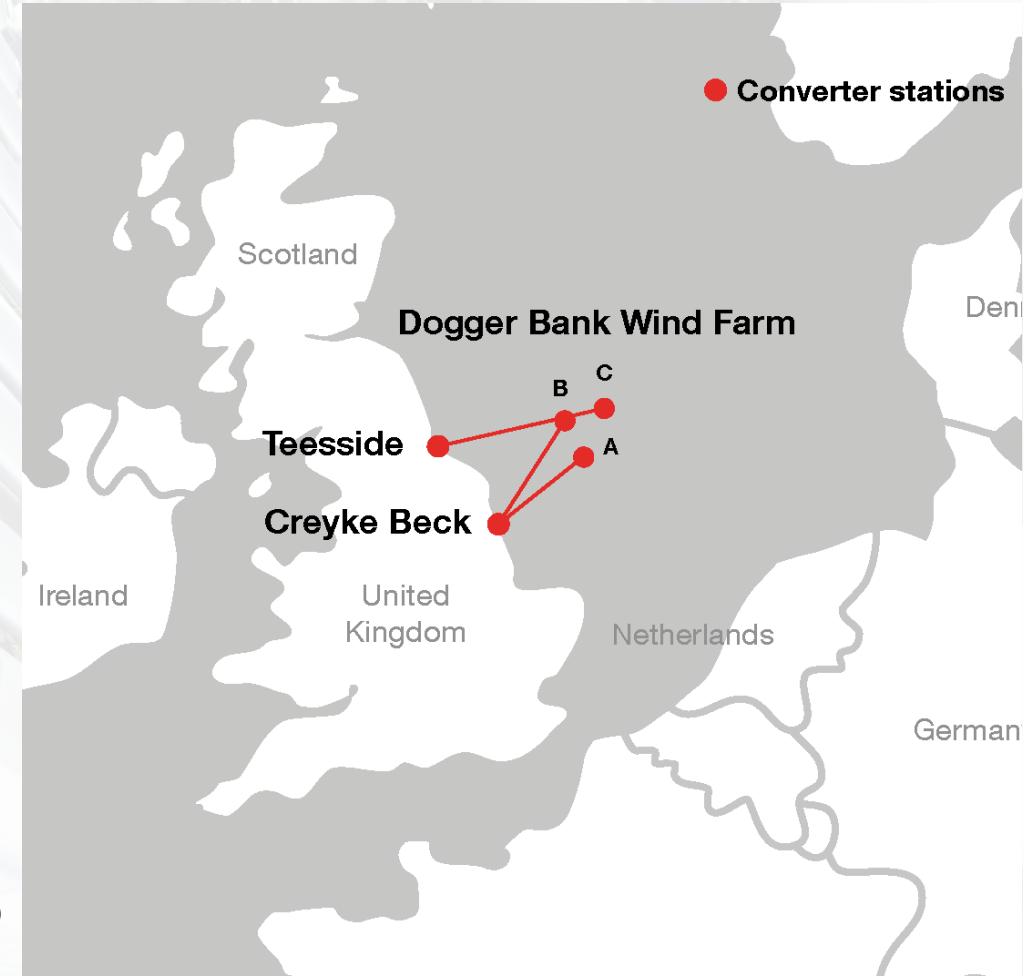

HVDC Light® converter stations

Symmetrical monopole

System capacity of 3 x 1200 megawatts (MW)

Supporting UK's clean electricity demand, powering six million UK homes

# Offshore wind connection: Dogger Bank A, B & C

Illustrated image of offshore wind connection by Aibel

Subsea option Caithness-Moray for faster deployment of transmission reinforcement.

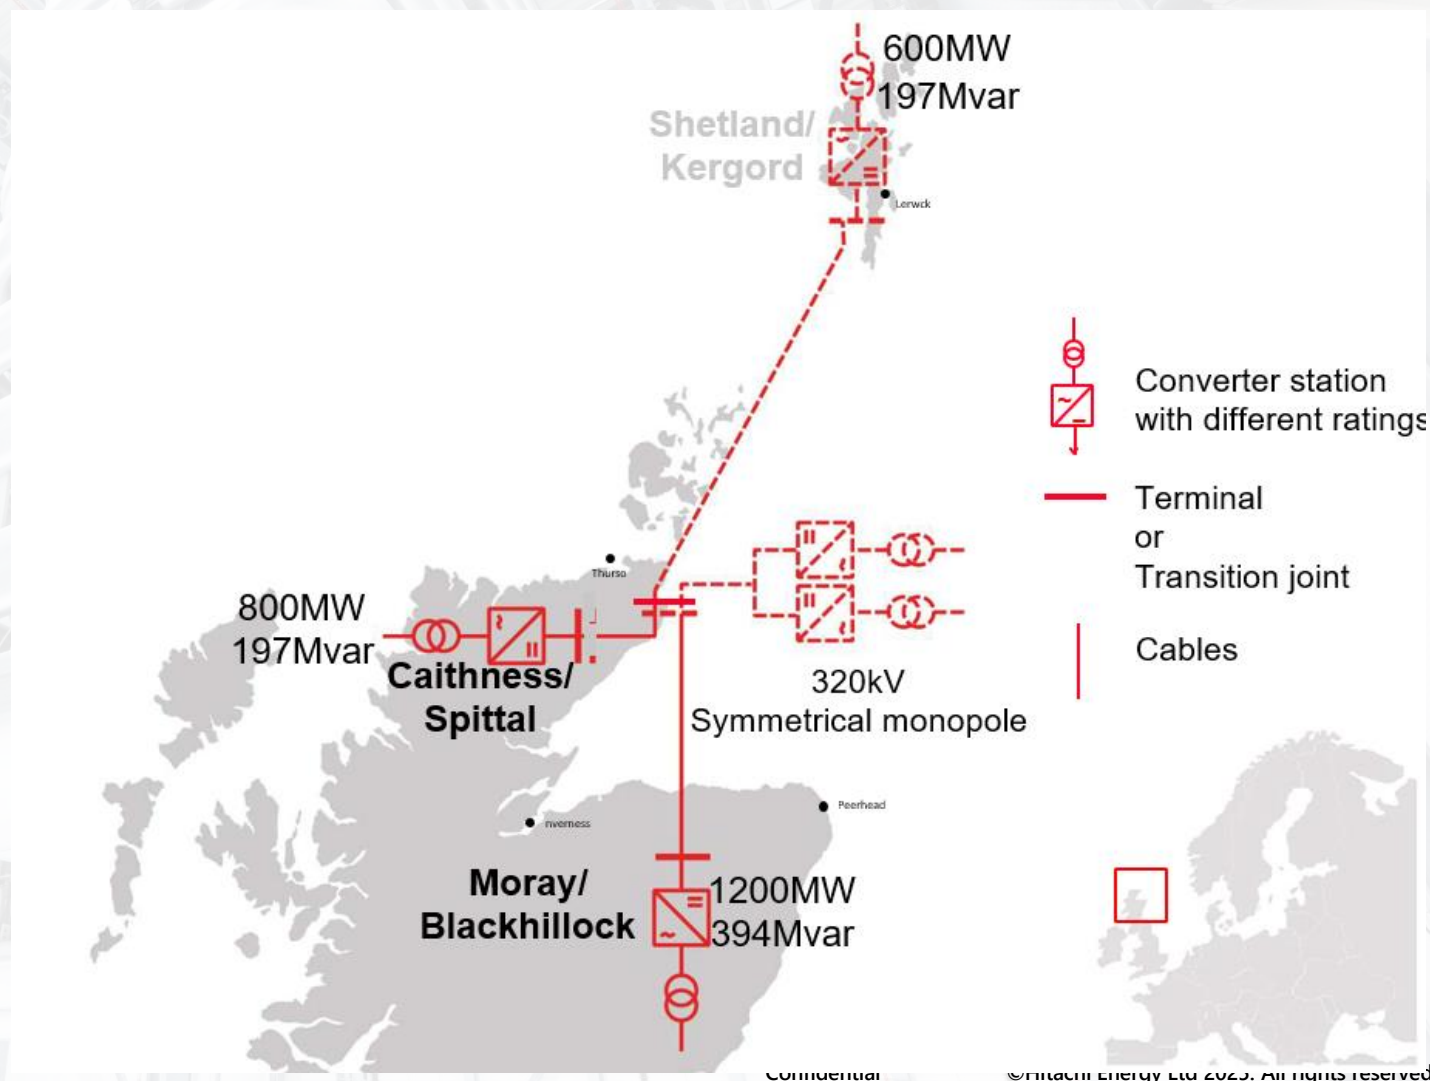

Less visual impact.

Additional technology benefits:

### **Multi-purpose HVDC –**

embedded HVDC link with interconnector/radial renewable power infeed.

CigréParis session 48, 2020, B4-116 Linden, Hanson and McHardy, Planning and implementation of an HVDC link embedded in a low fault level AC system with high penetration of wind generation”

# Power from shore “Project Lightning”

## Customer

ADNOC, United Arab Emirates

## Customer needs

- Enable power supply from mainland to platform complex to minimize emission of large amounts of CO<sub>2</sub>

## Our response

- Two HVDC Links with four HVDC Light® converter stations
- Zakum Cluster: Al Ghallan 132 kV (off-shore) and Mirfa 400 kV (on-shore), 2 x 1,000 MW
- DAS Cluster: Das 132 kV (offshore) and Shuweihat 400 kV (on-shore), 2 x 600 MW

## Customer benefits

- Enable sustainable, flexible and secure power supply to offshore platforms
- Reduction of carbon footprint for offshore operation
- High power ratings, compactness of converters on islands and long submarine cable distance

## Year

2024

HVDC Light®  
converter stations

- Symmetrical monopole to Al Ghallan island
- Bipole to DAS island

System capacity of 3,200  
megawatts (MW)

The first-of-its-kind sub-sea power transmission network in the MENA region advancing a sustainable energy future for Abu Dhabi

# Saudi Arabia – Egypt

## Saudi Arabia – Egypt

Customer	Saudi Electricity Company (SEC), Saudi Arabia and Egyptian Electricity Transmission Company (EETC), Egypt
Customer needs	<ul style="list-style-type: none"><li>• Power transmission and energy trading between countries</li></ul>
Our response	<ul style="list-style-type: none"><li>• 3000 MW ±500 kV multi-terminal solution with power flow in multiple directions</li><li>• Three turnkey HVDC converter stations:<ul style="list-style-type: none"><li>• Medina: 3000 MW (Saudi Arabia)</li><li>• Tabuk 1500 MW (Saudi Arabia)</li><li>• Badr 3000 MW (Egypt)</li></ul></li></ul>
Customer benefits	<ul style="list-style-type: none"><li>• Facilitate electricity trade between Saudi Arabia and Egypt</li><li>• Connecting the two grids with strengthening grid resilience</li><li>• Power supply security</li><li>• Optimization of energy production</li><li>• Addressing power consumption peaks by exchanging the surplus power with each other</li></ul>
Year	<ul style="list-style-type: none"><li>• 2025</li></ul>

“

HVDC is essential for grid reinforcement at speed and scale!

### Challenge

The energy transition leads to the **need of stronger, modernized power transmission system!**

### Solution

**HVDC** is needed for both integration and expansion of renewable energy sources.

### Impact

Stronger transmission system will ensure **secure power supply**.

Thank you for attention!
